

Company Overview

DBAM Systems is a leading provider of consolidated network traffic optimisation reporting and management solutions with its Exbander Precision (EP) and Exbander MAS ranges of products.

Installed in a rapidly expanding number of sites globally, the EP range of devices is the solution of choice for users who require consolidated control of their Internet traffic whatever the service or application. DBAM offers a complete range of solutions to fit the needs of all bandwidth consumers including business, health, education and ISP customers.

Enabling faster and higher availability of Internet connections by dynamically reducing congestion between contending applications, the unique combination of traffic shaping, load balancing, WAN acceleration, routing and analysis and reporting in a single device sets DBAM's solutions as leaders in this field.

EP devices are supplied with the Precision Start suite of integrated reporting and management modules, empowering IT Managers to manage and maximise their Local (LAN) and Wide (WAN) area networks like never before. A suite of EP add-on software modules and support contracts gives users the flexibility and choice to select options according to their specific and market needs.

Similarly innovative and market leading, Exbander MAS offers unparalleled service positioning and bandwidth control; enabling Internet Service Providers (ISPs) the control to target and deliver bandwidth resources to specific customers, thereby ensuring the delivery of flexibility to the customer; tiered services based on parameters such as time, bandwidth, volume of data flow and packets to best meet the quality based needs of their customers.

About DBAM Systems Ltd

Founded in the UK in 2003 following two years of product development; DBAM develops and markets a range of consolidated network traffic optimisation reporting and management solutions to users throughout EMEA. DBAM's products uniquely combine WAN acceleration, analysis and reporting, traffic shaping, load balancing and routing in a single device. The included Precision Start suite of integrated reporting and management modules empowers IT Managers to manage and optimise their Local (LAN) and Wide (WAN) area networks as never before. DBAM received a Gold award for its EP60 in February 2007 and was the world's first recipient of a dual Platinum Award for its EP6000 and WAN Acceleration technology in October 2007. Vision

DBAM Systems was founded on the vision of being the leading global supplier of consolidated network traffic optimisation reporting and management solutions.

In realising this vision, DBAM develops and implements solutions that give IT Managers control over their network traffic. With the increase of staff based away from Head Offices, new applications, VoIP and general use of the Internet, more traffic than ever before is conversing across networks. The ensuing poor performance on the network leads to lower productivity, employee frustration, degradation in customer service, increased network information costs and ultimately lost revenues. Adding bandwidth is a temporary, partial and expensive solution to these problems as it does not address performance issues across the LAN and WAN such as non-business related usage, the effect of latency and repetitive data transfers. DBAM's comprehensive and effective approach to solving these problems is to improve the network performance using a unique combination of traffic shaping, load balancing, WAN acceleration, routing and analysis and reporting in a single device.
